

## ABSTRACT

A micro adjuster laterally moves a paper punch die. A  
5 modified fixed bracket with a larger fine-threaded hole is used  
to retain a hollow micro adjuster screw which is engaged by the  
fine threads of the bracket. The retaining screw that attaches to  
the die now does so by being inserted through the hollow body of  
the micro adjuster screw and out of a clearance hole at the  
10 distal end. Fine lateral adjustments of lateral alignment  
between the paper to be punched and the die can now be performed  
by moving the die laterally.
